so D i F(a) is simply the result of differentiating F as a function of the single variable x i, holding the remaining variables fixed. Example 1 If f(x, y) = xy, then D 1 f(x, y) = y and D 2 f(x, y) = x. If g(x, y) = e x sin y, then D 1 g(x, y) = e x sin y and D 2 g(x, y) = e x cos y. To return to the matter of the tangent plane to S at F(a), note that

Advanced Calculus. This rigorous two-part treatment advances from functions of one variable to those of several variables. Intended for students who have already completed a one-year course in elementary calculus, it defers the introduction of functions of several variables for as long as possible, and adds clarity and simplicity by avoiding a mixture of heuristic and rigorous arguments.
