In the UK, our electricity is generated in a number of different ways. It is important to have different fuel sources and technologies to generate electricity so that we have a constant supply and are not overly reliant on one type of power generation. The different types of energy and the amount of electricity they create are listed below: Fossil fuels. Most of the UK's electricity is produced by burning fossil fuels, mainly natural gas (42% in 2016) and coal (9% in 2016).

Electricity is a convenient energy source because it is easily transmitted over distance via electricity cables, and has a wide variety of uses. However, electricity is not a primary energy source - it must be generated before it can be used, whether using coal, oil, natural gas or other fuels. Once it has been generated, the electricity goes to transformers to make it the correct voltage and then is supplied to homes and businesses through a network of cables and pylons.

*Generation and transmission of electricity*

Electricity is an energy currency, rather than an energy source, which means that electrical generation needs to start from a primary energy source like a fuel or a primary energy flow. These fuels and flows are usually turned into electric current which transmits electric power to the grid. Power plants are the most commonly used energy conversion technology to create electricity from primary energy.

*Electrical generation - Energy Education*

Electricity generation is the process of generating electric power from sources of primary energy. For utilities in the electric power industry, it is the stage prior to its delivery (transmission, distribution, etc.) to end users or its storage (using, for example, the pumped-storage method).
