Photonic crystals (PhCs) are periodically structured dielectric materials. They act as crystals for photons. Since their discovery in 1987 by John and Yablonovitch, there has been considerable...

(PDF) Photonic Crystals: Principles and Applications

A photonic crystal is a periodic optical nanostructure that affects the motion of photons in much the same way that ionic lattices affect electrons in solids. Photonic crystals occur in nature in the form of structural coloration and animal reflectors, and, in different forms, promise to be useful in a range of applications.. In 1887 the English physicist Lord Rayleigh experimented with ...

Photonic crystal - Wikipedia

A photonic crystal gives us new tools for the manipulation of photons and thus has received great interests in a variety of fields. There are numerous applications, including sub-wavelength imaging, scanning photon tunneling microscopy, and devices such as ultrahigh-sensitivity phase shifters and optical switches.

Applications of Photonic Crystals in Communications ...

One dimensional photonic crystals are used in thin film optics (Joannopoulos et al. 1995). Their applications are low-and high-reflection coatings on lenses or mirrors, color changing paints and inks etc. The two-dimensional ones are already spreading into commercial applications.
